

A sample document

Opened in your browser by OpenDocument Reader — this file was never uploaded anywhere.

What you are looking at is a real **office document**, decoded and laid out by the same C++ engine that powers the Android and iOS apps, compiled to WebAssembly and running *entirely inside this page*.

Formatting survives the trip

Bold, *italic*, colour, **highlight**, tables, lists and page geometry all come from the document itself — not from a screenshot and not from a conversion on a server.

- Text documents open as **Writer** wrote them
- Spreadsheets keep their **Calc** grid and cell formatting
- Presentations render slide by slide from **Impress**

Change something

Press the pen above this document. In a text document you can then type into this sentence, select a word and make it **bold**, *italic* or **marked**. In a PDF you can highlight a line or draw on the page. The disc beside the pen then downloads a file with your changes in it — written by the engine, on your machine.

A table, because tables are the hard part

Application	Open format	Also opens
Writer	ODT	DOC, DOCX, RTF
Calc	ODS	XLS, XLSX, CSV
Impress	ODP	PPT, PPTX

Now try your own

Drop any document onto the page. It stays on your machine — there is no upload, no account and no server involved.
